Fullstack website Developer | 07 July, 2021 - Present

- worked on various projects, from gathering requirements and improving design of existing websites, to developing fully functional websites and deploying them on shared hosting based on client needs.

- collaborated with other developers making awesome websites.

Projects

[Arabian Computer Company Website](#)

While working at Arabian Computer Company, my responsibilities included enhancing the performance and search engine optimization (SEO) of the company's website. Initially, the website was developed using pure PHP, jQuery, and Bootstrap. However, the marketing team wanted a new design and features for the website. To meet their requirements, I modified the codebase and shifted to Laravel, Tailwind CSS, and Alpine.js. This resulted in a responsive website with excellent performance and a high SEO score. Additionally, I developed a dashboard for the team to manage website content.

Job posting website for the national civil service selection commission

I developed a job posting website for government agencies where eligible students can apply for job openings based on qualifications and time of the application. To create the platform, I utilized Laravel, Inertia Vuejs, and Tailwindcss. The website comprises two main parts: a front-end that enables users to browse available job openings and apply, and a dashboard to manage job listings and applications.

School Management System

While working at Arabian Computer Company, I developed a school system to manage student registrations and exam results calculations. The initial system was created using pure PHP. My task was to re-create the system using Laravel and add more features to it. As a result, I added a discount system and the ability to manage school bus fees to the application.

Personal Portfolio

I used Tailwind CSS and Nuxt.js to construct a personal website that showcases my personal information and the projects I have worked on.

Technologies

- HTML
- CSS
- SASS
- Bootstrap
- Tailwindcss
- Javascript
- Vuejs
- Vuex
- PHP
- Laravel
- MySQL
- Git
- Github
